

Pour se remettre dans le bain

Pour se remettre dans le bain

1. Quelle est la différence entre *statistical learning* et *machine learning* ?
2. Donner la définition d'un algorithme d'apprentissage.
3. Quels sont les quatre grands types d'apprentissage ?
4. Que définissent *fat data* et *tall data* ?
5. Comment compare-t-on les performances d'algorithmes d'apprentissage ?
6. Quelle notion est souvent cruciale au moment de choisir une bonne fonction de perte ? En donner la définition.
7. Donner quelques exemples de fonctions de perte.
8. Enoncer le théorème de Bayes.
9. Quel est le rôle de la distribution *a priori* ?
10. Donner la définition d'un modèle bayésien.
11. Quelles sont les quatre distributions importantes en bayésien ?

The posterior distribution

$$\pi(\theta|\mathbf{x}) \propto f(\mathbf{x}|\theta)\pi(\theta)$$

The posterior distribution

$$\pi(\theta|\mathbf{x}) \propto f(\mathbf{x}|\theta)\pi(\theta)$$

- ▶ Operates conditional upon the observations.

The posterior distribution

$$\pi(\theta|\mathbf{x}) \propto f(\mathbf{x}|\theta)\pi(\theta)$$

- ▶ Operates conditional upon the observations.
- ▶ Integrates simultaneously prior knowledge and information brought by data.

The posterior distribution

$$\pi(\theta|\mathbf{x}) \propto f(\mathbf{x}|\theta)\pi(\theta)$$

- ▶ Operates conditional upon the observations.
- ▶ Integrates simultaneously prior knowledge and information brought by data.
- ▶ Coherent and complete inferential scope and unique motor of inference.

The posterior distribution

$$\pi(\theta|\mathbf{x}) \propto f(\mathbf{x}|\theta)\pi(\theta)$$

- ▶ Operates conditional upon the observations.
- ▶ Integrates simultaneously prior knowledge and information brought by data.
- ▶ Coherent and complete inferential scope and unique motor of inference.
- ▶ Usually known up to a constant! $m(\mathbf{x})$ may be intractable.

Prior distributions

There is no such thing as *the* prior distribution!

Prior distributions

There is no such thing as *the* prior distribution!

Usually encapsulates *prior* knowledge on θ .

Prior distributions

There is no such thing as *the* prior distribution!

Usually encapsulates *prior* knowledge on θ .

Vague priors (such as $\theta \sim \mathcal{N}(0, 100)$).

Prior distributions

There is no such thing as *the* prior distribution!

Usually encapsulates *prior* knowledge on θ .

Vague priors (such as $\theta \sim \mathcal{N}(0, 100)$).

Improper priors: $\int \pi(\theta) d\theta = +\infty$.

Prior distributions

There is no such thing as *the* prior distribution!

Usually encapsulates *prior* knowledge on θ .

Vague priors (such as $\theta \sim \mathcal{N}(0, 100)$).

Improper priors: $\int \pi(\theta) d\theta = +\infty$.

A prior on θ may depend on additional parameters: those are called hyperparameters.

Conjugacy and explicit calculus of posteriors

Conjugate priors are a specific family of distributions with nice analytical properties.

Conjugacy and explicit calculus of posteriors

Conjugate priors are a specific family of distributions with nice analytical properties.

A family \mathcal{F} of probability distributions is *conjugate* for a likelihood $f(x|\theta)$ if for every $\pi \in \mathcal{F}$, the posterior distribution $\pi(\theta|x)$ also belongs to \mathcal{F} .

Conjugacy and explicit calculus of posteriors

Conjugate priors are a specific family of distributions with nice analytical properties.

A family \mathcal{F} of probability distributions is *conjugate* for a likelihood $f(x|\theta)$ if for every $\pi \in \mathcal{F}$, the posterior distribution $\pi(\theta|x)$ also belongs to \mathcal{F} .

Only of interest when \mathcal{F} is parameterized: switching from the prior to the posterior is reduced to an update of parameters.

Advantages

- ▶ Limited/finite information conveyed by data x

Advantages

- ▶ Limited/finite information conveyed by data x
- ▶ Preservation of the structure of the prior $\pi(\theta)$

Advantages

- ▶ Limited/finite information conveyed by data x
- ▶ Preservation of the structure of the prior $\pi(\theta)$
- ▶ Exchangeability

Advantages

- ▶ Limited/finite information conveyed by data x
- ▶ Preservation of the structure of the prior $\pi(\theta)$
- ▶ Exchangeability
- ▶ Allows for generation of "virtual observations"

Advantages

- ▶ Limited/finite information conveyed by data x
- ▶ Preservation of the structure of the prior $\pi(\theta)$
- ▶ Exchangeability
- ▶ Allows for generation of "virtual observations"
- ▶ Most importantly: **tractability and simplicity**

Exponential families

The family of distributions

$$f(x|\theta) = C(\theta)h(x) \exp(R(\theta)T(x))$$

is called an *exponential family*.

Exponential families

The family of distributions

$$f(x|\theta) = C(\theta)h(x) \exp(R(\theta)T(x))$$

is called an *exponential family*. When

$$f(x|\theta) = h(x) \exp(-\theta x - \psi(\theta))$$

the family is said to be *natural*.

Exponential families

The family of distributions

$$f(x|\theta) = C(\theta)h(x) \exp(R(\theta)T(x))$$

is called an *exponential family*. When

$$f(x|\theta) = h(x) \exp(-\theta x - \psi(\theta))$$

the family is said to be *natural*.

Main interest: allow for conjugate priors

$$\pi(\theta|\mu, \lambda) = K(\mu, \lambda) \exp(\theta\mu - \lambda\psi(\theta)), \quad \lambda > 0.$$

Non-informative priors: Jeffreys priors

Based on Fisher information:

$$I(\theta) = -\mathbb{E} \left[\frac{\partial^2 \log \mathcal{L}(\theta|x)}{\partial \theta^2} \right].$$

Non-informative priors: Jeffreys priors

Based on Fisher information:

$$I(\theta) = -\mathbb{E} \left[\frac{\partial^2 \log \mathcal{L}(\theta|x)}{\partial \theta^2} \right].$$

Jeffreys prior is defined as

$$\pi^*(\theta) \propto \det(I(\theta))^{1/2}.$$

Non-informative priors: Jeffreys priors

Based on Fisher information:

$$I(\theta) = -\mathbb{E} \left[\frac{\partial^2 \log \mathcal{L}(\theta|x)}{\partial \theta^2} \right].$$

Jeffreys prior is defined as

$$\pi^*(\theta) \propto \det(I(\theta))^{1/2}.$$

Pros & Cons:

Non-informative priors: Jeffreys priors

Based on Fisher information:

$$I(\theta) = -\mathbb{E} \left[\frac{\partial^2 \log \mathcal{L}(\theta|x)}{\partial \theta^2} \right].$$

Jeffreys prior is defined as

$$\pi^*(\theta) \propto \det(I(\theta))^{1/2}.$$

Pros & Cons:

- Relates to information theory

Non-informative priors: Jeffreys priors

Based on Fisher information:

$$I(\theta) = -\mathbb{E} \left[\frac{\partial^2 \log \mathcal{L}(\theta|x)}{\partial \theta^2} \right].$$

Jeffreys prior is defined as

$$\pi^*(\theta) \propto \det(I(\theta))^{1/2}.$$

Pros & Cons:

- ▶ Relates to information theory
- ▶ Parameterization invariant

Non-informative priors: Jeffreys priors

Based on Fisher information:

$$I(\theta) = -\mathbb{E} \left[\frac{\partial^2 \log \mathcal{L}(\theta|x)}{\partial \theta^2} \right].$$

Jeffreys prior is defined as

$$\pi^*(\theta) \propto \det(I(\theta))^{1/2}.$$

Pros & Cons:

- ▶ Relates to information theory
- ▶ Parameterization invariant
- ▶ Suffers from dimensionality curse

Non-informative priors: Jeffreys priors

Based on Fisher information:

$$I(\theta) = -\mathbb{E} \left[\frac{\partial^2 \log \mathcal{L}(\theta|x)}{\partial \theta^2} \right].$$

Jeffreys prior is defined as

$$\pi^*(\theta) \propto \det(I(\theta))^{1/2}.$$

Pros & Cons:

- ▶ Relates to information theory
- ▶ Parameterization invariant
- ▶ Suffers from dimensionality curse
- ▶ Depends on data: incoherence with the likelihood principle

Example

If $x \sim \mathcal{B}(n, \theta)$, Jeffreys' prior is

$$\pi(\theta) \propto \mathcal{B}e(1/2, 1/2).$$

If $n \sim \text{Neg}(x, \theta)$, Jeffreys' prior is

$$\pi(\theta) \propto \theta^{-1}(1 - \theta)^{-1/2}$$

Non-informative priors: Laplace priors

With a finite set $\{\theta_1, \dots, \theta_p\}$, uniform prior $\pi(\theta_i) = 1/p$.

Non-informative priors: Laplace priors

With a finite set $\{\theta_1, \dots, \theta_p\}$, uniform prior $\pi(\theta_i) = 1/p$.

Continuous extension: $\pi(\theta) \propto 1$. This is no longer a probability distribution yet if $\int f(x|\theta)d\theta < +\infty$, the posterior is well-defined as a probability distribution. Modeling is crucial. Weakness: lack of reparameterization invariance.
